

Astigmatic mirror

This chart accurately show any distortion caused by astigmatism. If you have astigmatism you may see some of the lines distinctly darker than others. The axis of the darker lines indicate the axis in which you have astigmatism.

Look at this chart from different distances, since you can have astigmatism in selected areas only. For example, some people have astigmatism only at short distances and not when looking at far objects.

People with no astigmatism see all the lines in the same colour and density and with the same spacing.
